bacterial pathogenicity factors are functionally diverse they may facilitate the adhesion and colonization of bacteria influence the host immune response assist spreading of the bacterium by e g evading recognition by immune cells or allow bacteria to dwell within protected niches inside the eukaryotic cell exotoxins can be single polypeptides or heteromeric protein complexes that act on different parts of the cells at the cell surface they may insert into the membrane to cause damage bind to receptors to initiate their uptake or facilitate the interaction with other cell types for example bacterial superantigens specifically bind to major histocompatibility complex mhc ii molecules on the surface of antigen presenting cells and the t cell receptor while cytolysins cause pore formation for intracellular activity exotoxins need to be translocated across the eukaryotic membrane gram negative bacteria can directly inject effector proteins in a receptor independent manner by use of specialized needle apparatus such as bacterial type ii iii or type iv secretion systems other methods of translocation include the phagocytic uptake of bacteria followed by toxin secretion or receptor mediated endocytosis which allows the targeting of distinct cell types receptor based uptake is initiated by the binding of heteromeric toxin complexes to the cell surface and completed by the translocation of the effector protein s across the endosomal membrane in the cytosol toxins interact with specific eukaryotic target proteins to cause post translational modifications that often result in the manipulation of cellular signalling cascades and inflammatory responses it has become evident that the actions of some bacterial toxins may exceed their originally assumed cytotoxic function for example pore forming toxins do not only cause cytolysis but may also induce autophagy pyroptosis or activation of the mapk pathways resulting in adjustment of the host immune response to infection and modification of inflammatory responses both locally and systemically other recently elucidated examples of the immunomodulatory function of cell death inducing exotoxins include tcdb of clostridium difficile which activates the inflammasome through modification of cellular rho gtpases or the staphylococcus d toxin which activates mast cells the goal of this research topic was to gather current knowledge on the interaction of bacterial

exotoxins and effector proteins with the host immune system the following 16 research and review articles in this special issue describe mechanisms of immune modification and evasion and provide an overview over the complexity of bacterial toxin interaction with different cells of the immune system

a must read handbook for organic gardeners and small scale growers thanks to research conducted over the last few decades we know that most plants get a significant portion of their nutrients by attracting endophytic bacteria bacteria that live inside a plant s cells through a complex process plant cells harvest the nitrogen and other nutrients in a bacterium s cell wall and expel the bacterium s protoplasts back into the soil where they rebuild their cell walls start feeding again and repeat the cycle interesting you may think but why does this matter as it turns out it matters a lot the bottom line is this without endophytic bacteria plants get fewer nutrients and cannot develop properly teaming with bacteria not only explains the rhizophagy cycle it shows you how to harness this amazing process to increase productivity and plant health in addition endophytic bacteria increase a plant s tolerances to abiotic and biotic stresses and controlling pathogens this is exactly what we need if we are to deal effectively with climate change soil loss and feeding a rapidly burgeoning population gardeners farmers and other growers must adjust best practices and develop new ones to ensure that the rhizophagy cycle can operate at its most efficient pace and that the right endophytic bacteria can do what they are supposed to do just as teaming with microbes introduced gardeners and growers to the soil food web teaming with bacteria adds to that science by sharing the latest research on endophytic bacteria bacteria that live inside plants and rhizophagy plants eating bacteria discoveries that have profound implications for the practices of home gardeners and small scale growers
